## 25 **Foreword**

26 This Recommendation facilitates and encourages constituting a transboundary trust space for  
27 the international legally significant exchange of electronic documents and data between public  
28 authorities, physical and legal persons. The Recommendation may attract attention of an  
29 audience who is involved/interested in the establishment and operation as well as in the  
30 practical usage of such transboundary infrastructures.

## 31 **Executive summary**

32 The general purpose upheld by this Recommendation is to guarantee ensuring rights and legal  
33 interests of citizens and organizations under the jurisdiction of United Nations Member States  
34 while performing legally significant information transactions in electronic form using the  
35 Internet and other open ICT systems of mass usage.

36 This institutional guarantees are proposed to be ensured within business activity of specialized  
37 operators which:

- 38 - provide users with a set of trusted ICT services;
- 39 - operate within established legal regimes, which include but are not limited to  
40 restrictions imposed by processing of personal data.

41 Current Recommendation covers only the provisions concerning trusted ICT services.  
42 Provisions regarding establishing appropriate legal regimes may be subject matter of a  
43 dedicated Recommendation by UNCITRAL.

44 Any participants of electronic interaction deal with some kind of ICT services (email, cloud  
45 storages, web-portals etc.). If participants have a high degree of confidence in each other and  
46 in ICT services they use, then nothing is to be changed. But if participants are not sufficiently  
47 confident in each other and/or in ICT services, then there should be a third party increasing  
48 the degree of confidence in electronic interaction on the whole. The role of these third parties  
49 play trust services.

50 Trust services may be of different types (provide different functions) and of different levels of  
51 qualification. High level qualification trust services operates under some international legal  
52 agreements, they meet the requirements and follow the rules laid down by some international  
53 coordinator. Basic level qualification trust services operates under some commercial  
54 agreements, they can be established within some large scale international projects and follow  
55 the recognized best practices for trust service providers. Trust services should be audited in  
56 accordance with their level of qualification.

57 The aggregate of trust services with the legal, organizational and technical framework forms  
58 the Common Trust Infrastructure (hereinafter CTI). The CTI is a fundamental, easily scalable  
59 infrastructural platform providing a unified access to trust services.

60 **1. Recommendation № \_\_\_\_ : Recommendation for ensuring**  
61 **legally significant trusted trans-boundary electronic**  
62 **interaction**

63 **1.1. Scope**

64 This Recommendation seeks to encourage the use of electronic data transfer in international  
65 trade scenarios by recommending Governments the principles of establishing and operating  
66 regional and global coordination organizations for ensuring trust in international exchange of  
67 data and electronic documents between participants.

68 **1.2. Benefits**

69 Harmonized regional and global coordination based on common principles will provide a  
70 smooth, transparent and liable environment for electronic activities in trans-boundary trade  
71 scenarios. This will make it possible to attach legal significance to an electronic interaction  
72 for legal bodies and economic operators regardless of their location and jurisdiction.

73 **1.3. Use of International Standards**

74 The use of international standards can play a key role in larger acceptance of chosen solutions  
75 and eventually interoperability. Insofar as possible, legal and private actors who intend to use  
76 electronic data transfer in international trade scenarios should try to make use of existing  
77 international standards. Technical standards which were able to be identified during the  
78 development of this Recommendation are referenced in Annex B.

79 **1.4. Recommendation**

80 The existing natural peculiarities (historical, cultural, political, economic, technical, etc) of  
81 different world regions cause also different level of trust within these regions concerning  
82 *electronic interaction*.

83 To Governments and entities engaged in the international trade and movement of goods,  
84 providing services and payment processing and willing a tighter, more transparent, effective  
85 and easier co-operation concerning *electronic interactions*, the United Nations Centre for  
86 Trade Facilitation and Electronic Business (UN/CEFACT) recommends establishing and  
87 using a dedicated Common Trust Infrastructure (hereinafter CTI).

88 The primary objective of CTI is ensuring *legally significant electronic interactions* between  
89 its users by providing *trust services* of different qualifications (zero, basic, high) to the  
90 participants of *electronic interaction*.

91 The CTI is a fundamental, easily scalable platform providing a unified access to trust services.  
92 Herewith, the existing electronic systems are taken into account, so the requirements to their  
93 updating for connecting to the CTI are expected to be minimal.

94 In order to achieve this objective, UN/CEFACT recommends:

- 95 – CTI establishment principles;
- 96 – CTI coordination approaches;
- 97 – approaches ensuring technical interoperability of CTI services;
- 98 – levels of trust provided by CTI;
- 99 – standardization organizations to co-operate with.

## 100 2. Guidelines on how to implement the recommendation

### 101 2.1. Terms and Definitions<sup>1</sup>

102 For the purposes of this document the following terms apply:

#### 103 ***Common Trust Infrastructure (CTI)***

104 – infrastructure ensuring the legal significance of transboundary electronic interaction. CTI  
105 provides a set of trust services harmonized on the legal, organizational and technical /  
106 technological levels to its users.

107 ***degree of confidence*** (of the participants of *information interaction* in each other and in the  
108 ICT services processing *electronic interaction* between them)

109 – a societal function of an established or felt degree of confidence of the participants of  
110 *information interaction* in each other and in the ICT services processing *electronic*  
111 *interaction* between them.

#### 112 ***electronic interaction***

113 – a way of *information interaction* based on use of information and communication  
114 technologies (ICT). ICT refers to technologies that provide information processing  
115 (creation, storage, access, transformation, transmission, destruction, etc.) in the  
116 telecommunication context<sup>2</sup>. Any electronic interaction deals with *ICT services* (internet  
117 provider, email provider, message exchange services of any kind, cloud storages etc.).

#### 118 ***legal significance (of an action)***

119 – a property of an action (of a process) to originate (to result in) documents (*data unit*)  
120 possessing *legal validity*.

#### 121 ***legal validity (of a document, or, generally, of data)***

122 – a property of a document (*data unit*) to be applicable for judicature, i.e. be deemed to have  
123 satisfied the requirements of applicable law. The *legal validity* is conferred to a document  
124 by the legislation in force, by the authority of its issuer and by the established order of its  
125 issuing (e.g. it shall be usable for a subsequent reference).

#### 126 ***level of qualification (of a service)***

127 – a property of a *service* to evidently fulfill a pre-defined set of requirements on it.

#### 128 ***levels of trust*** (between the *trust domains*)

129 – a societal function determining the degree of trust between the *trust domain*. Depending  
130 on an established level of trust, *trust domains* are prepared to share a certain amount of  
131 resources and to jointly use certain infrastructures, i.e. *trust domains* are prepared to  
132 delegate part of their inherent powers, functions and resources to a common trust  
133 infrastructure (CTI), in which they jointly trust. The higher is the level of trust in this CTI  
134 the more inherent powers *trust domains* are prepared to delegate to the CTI.

#### 135 ***participants of electronic interaction***

136 – entirety of public authorities, physical and legal persons interacting within relations  
137 arising from *electronic interaction*.

---

<sup>1</sup> *Italic face* tags the terms defined in the current Recommendation

<sup>2</sup> ICT is similar to Information Technology (IT), but focuses primarily on communication technologies. This includes the Internet, wireless networks, cell phones, and other communication mediums

138 ***transboundary trust space (TTS)***

139 – an aggregate of legal, organizational and technical conditions recommended by relevant  
140 specialized UN agencies (departments) and international organizations with the aim of  
141 ensuring trust (a certain degree of confidence) in international exchange of electronic  
142 documents and data between participants of *electronic interaction*.

143 ***trust service***

144 – (high level definition) - an electronic service purposing to ensure a certain *degree of*  
145 *confidence* between the participants of *electronic interaction*.

146 ***trusted electronic interaction***

147 – the exchange of any data in electronic form in such a way that a user of these data  
148 undoubtedly accepts them according to its Operational Policy. It is a matter of a concrete  
149 Operational Policy, which way is considered as a *trusted* one. Hence, the determination of  
150 the trustworthy of some data varies from one concrete case to another. Trusted electronic  
151 interaction is provided by using *trust services*.

152 **2.2. Common Trust Infrastructure establishment principles**

153 – **Scalability.** The CTI is established in such a way that it can be easily scaled. It broadens  
154 easily at any level of consideration due to the accession of new participants, such as new  
155 jurisdictions, new supranational participants, new operators of trust services, and register  
156 systems.

157 – **Traceability.** Any fact of electronic data exchange within the CTI should be fixed and  
158 available for conflict resolutions if necessary.

159 – **Cost efficiency.** While the CTI architecture variants comparison the risk analysis should  
160 be taken into account.

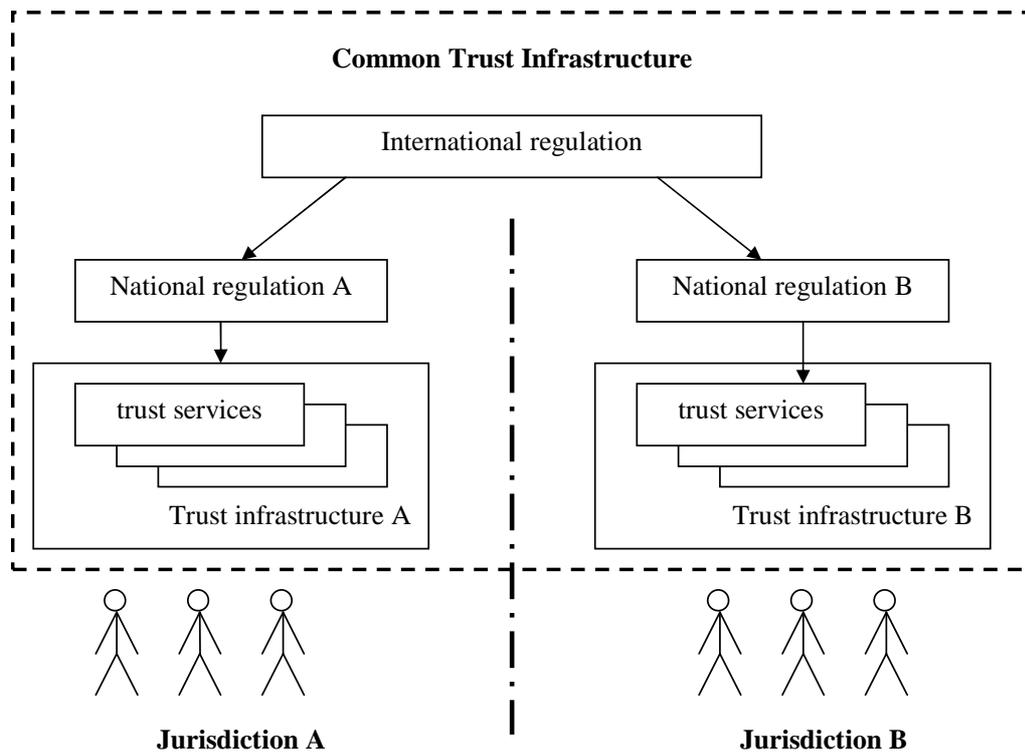

161 – **Complexity.** Coherent elaboration of legal, organizational and technological issues should  
162 be done within CTI establishment. A complex description allows correct functioning of  
163 the system as a whole and its single elements.

164 **2.3. Common Trust Infrastructures coordination approaches**

165 The CTI architecture is selected according to the principals stated in sec. 2.2 above. There are  
166 three levels of CTI coordination: legal, organizational and technological.

167 **Legal level**

168 The CTI can be built on a single- or multi-domain basis. In the context of legal and  
169 organizational regulation, the multi-domain basis is the most complicated variant. Fig. 1 gives  
170 a general scheme of a legal regulation.

**Fig.1. Legal level**

171  
172

173 Legal regulation of CTI interaction can be divided in two parts: international and national.  
174 The international legal regulation is carried out on the basis of the following types of  
175 documents:

- 176 – international treaties/agreements;
- 177 – acts of different international organizations;
- 178 – international standards and regulations;
- 179 – agreements between participants of transboundary information interaction on given issues;
- 180 – model acts.

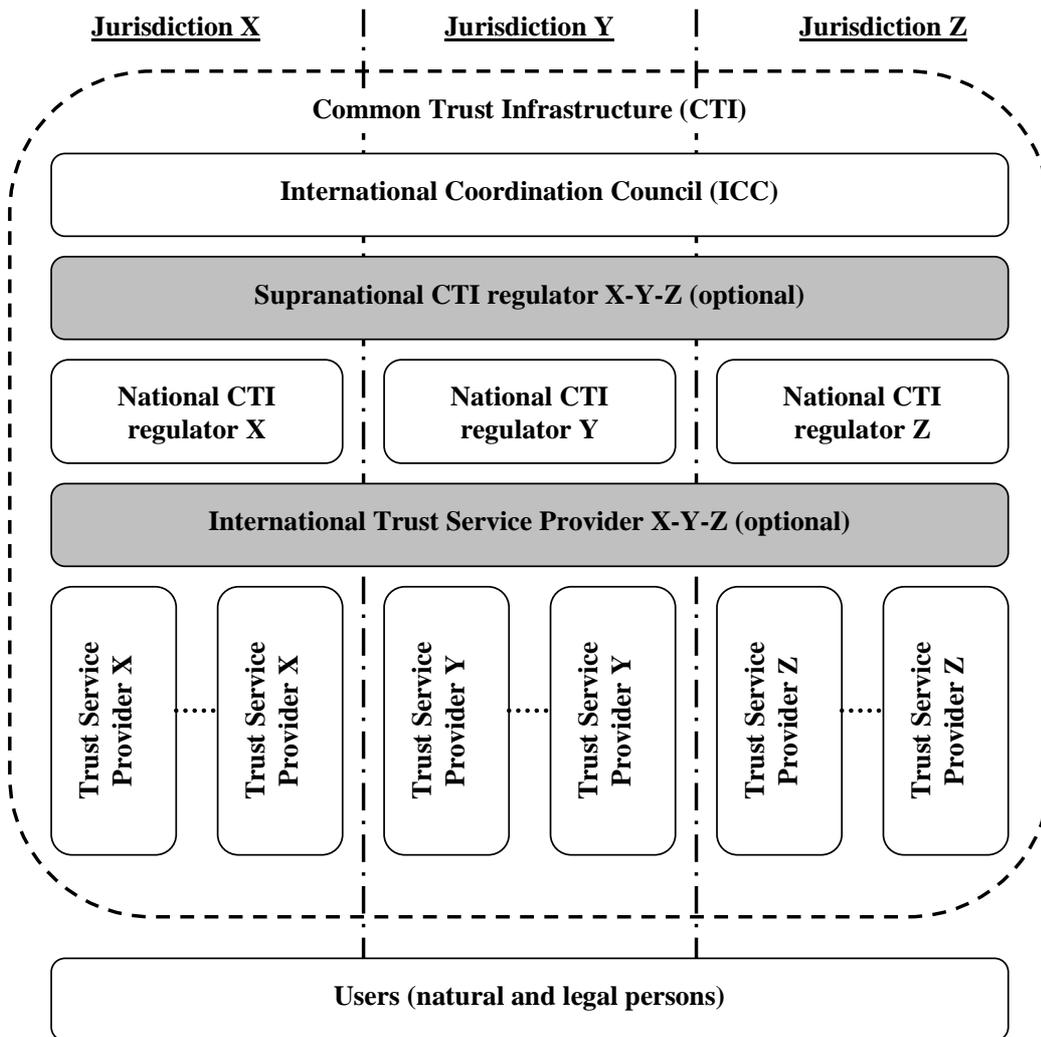

181 The national legal regulation is built on a complex of normative documents that are standard  
182 in each particular jurisdiction.

183 We recommend a tight cooperation with UNCITRAL in order to harmonize the effort of this  
184 Recommendation concerning the necessary coordination on the legal level, see sec. 2.6.

### 185 **Organizational level**

186 Mutual legally significant recognition of trust services provided under various jurisdictions is  
187 reached through creation and operation of a dedicated body (let call it International  
188 Coordination Council or ICC) that includes national regulation bodies having voluntarily  
189 joined the ICC. The activity of ICC is regulated by the ICC Statute which is to be recognized  
190 and signed by all its authorized members – that is the Regulation Bodies of the Electronic  
191 Data Exchange represented primarily by the National CTI Regulators.

192 Fig. 2 gives a general scheme of the organizational level of coordination.

193  
194 **Fig. 2. Organizational level (optional elements are identified by the**  
195 **grey blocks)**

- 196 The ICC issues a number of documents interconnected with its Statute:
- 197 – *Requirements* for the ICC members, correspondence to which is a prerequisite for the full
  - 198 membership in the ICC;
  - 199 – *Guidelines* on carrying out ‘shadow’ supervision for admittance to the ICC and periodic
  - 200 mutual audit for maintaining voluntary membership in the ICC;
  - 201 – *Compliance criteria* which are to be met by operators of the trust services, and the
  - 202 methodology for applying these criteria;
  - 203 – *Scheme of estimation/verification* of operators of the trust services with respect to their
  - 204 meeting these criteria.

205 In the CTI, each jurisdiction is presented by the National CTI regulator (see Fig. 2, National  
206 CTI regulators X, Y, Z) which regulates the activity of operators of the trust services within  
207 their jurisdiction.

208 For groups of states with high degree of integration (for example, Eurasian Economic Union  
209 member-states or European Union member-states) there is the possibility of constituting a  
210 Supranational CTI regulator (see. Fig. 2, Supranational CTI regulator X-Y-Z). Thus, one  
211 Supranational CTI regulator X-Y-Z substitutes a group of National CTI regulators X, Y and  
212 Z.

213 The natural CTI scalability is enabled through the procedure for admitting new members to  
214 the ICC (new national and supranational participants) and the scheme for verifying the  
215 operators of the trust services with respect to their meeting the *Compliance criteria* issued by  
216 the ICC (new operators of the trust services).

217 International operators of the trust services (international TSPs) can provide, inter alia, neutral  
218 inter-domain gateways (nIDG) as a specific type of trust services. The main nIDGs' function  
219 is providing a mutual recognition (legalisation) of electronic documents and data. These  
220 nIDGs connecting single domains represent the elements of building a CTI.

221 nIDGs can be established both: at only legal and organizational levels and at a complex level:  
222 legal, organizational and technical one.

223 In the first case, the communicating domains establish a common legal basis for the  
224 cooperation between them, see sec. 'Legal level' above. This legal basis defines a full set of  
225 the requirements, conditions and prerequisites enabling and even guaranteeing a mutual legal  
226 recognition (legalisation) of legally-significant electronic documents as such.

227 On the organizational level, procedures and processes of interaction between different  
228 domains of the TTS shall uphold the level of trust between these domains being sufficient for  
229 a mutual recognition (legalisation) of electronic documents and data, which are issued in  
230 different domains or jurisdictions.

231 In order to achieve this necessary level of trust, this set of the requirements, conditions and  
232 prerequisites shall regulate, inter alia, the establishment and operation of a neutral  
233 international environment, i.e. of an environment outside (beyond) any single domain. The  
234 ICC and International operators represent parts of this neutral international environment. Such  
235 a neutral international environment shall be operated in a neutral legal field that is defined, for  
236 example, by a UN Convention or by an international treaty between single countries or unions  
237 of countries, see sec. 'Legal level' above.

238 I.e. in the case, when nIDGs are established at only legal and organizational levels, these  
239 nIDGs are implemented merely by treaties, agreements and organizational procedures. This  
240 legal and organizational infrastructure may be supported by different single trust services like  
241 e-signature verification, powers verification, time stamping etc., but without a specific trust  
242 service dedicated to the purpose to be a gateway.

243 In the second case, when nIDGs are established at legal, organizational and technical levels,  
244 nIDGs additionally transform a document in such a way that it will fulfill the requirements  
245 (attributes, format, structure, etc.) for legally-significant electronic documents in recipient's  
246 domain<sup>3</sup> (jurisdiction). In such a way the nIDG trust service can substitute a number of trust  
247 services that provide only single specific functions (e-signature verification, powers

---

<sup>3</sup> 'Domain' or 'trust domain' can coincide with a single jurisdiction or can unite several jurisdictions.

248 verification, time stamping etc.). As ever, even technically implemented nIDG trust service  
249 shall also be operated in a neutral international environment.

250 Approaches to forming nIDGs should regard usage of transition profiles describing and  
251 configuring transitions from one domain to another. These transition profiles should consider,  
252 inter alia, the legal basis of the cooperation between the communicating domains and the trust  
253 levels of the identification schemes used inside the interacting domains, as well.

254 In order to become a National Trust Service Provider (TSP; operator of the trust service), a  
255 supplier of the respective services shall undergo accreditation with the National CTI regulator  
256 of the same jurisdiction. International Trust Service Providers shall undergo accreditation  
257 with the ICC. The requirements for accreditation of the operators of the trust services, as well  
258 as the requirements to their activity are regulated by the *Compliance criteria* issued by the  
259 ICC and possible national supplements issued by the respective National CTI regulator.

260 In the ICC, the users of electronic services can be both individuals and legal entities. The  
261 users select the necessary *level of qualification* of a trust service at their discretion or in an  
262 agreement.

263 The services are provided by the respective suppliers – the trust service providers. The trust  
264 service providers are integrated by the CTI.

265 The trust services as the CTI elements can have different variants of realization depending on  
266 the *level of trust* between trust domains (jurisdictions). For example, with conditionally ‘high’  
267 or ‘medium’ level of mutual trust between the CTI members, it is efficient to use centralized  
268 International trust services applied according to the standards agreed upon. In case of  
269 conditionally ‘low’ level of trust, the trust services are built according to the decentralized  
270 principle – National trust services in each single jurisdiction.

#### 271 **Technological level**

272 There can be a great number of technological options for trust services’ realization. The main  
273 requirement to the CTI elements is interoperability. Regulation at this level is carried out with  
274 application of different standards and instructions set forth by the ICC documents.

275 We recommend a tight cooperation with major organizations in the area of technical  
276 standardization such as *ISO, ETSI, W3C* and others in order to harmonize the effort of this  
277 Recommendation concerning the necessary coordination on the technological level, see sec.  
278 2.6.

#### 279 **2.4. Trust infrastructures services technical interoperability ensuring approaches**

280 To workout trust services types it is proposed to consider base document’s attributes that are  
281 necessary to provide document’s legal function fulfillment.

<b>№</b>	<b>Attribute type</b>	<b>Mandatory yes/no</b>	<b>Description/comments</b>
1.	Content	yes	An aggregate of at least one of the following attributes is the <i>content</i> , the informational essence of a document, which is to be irrespective to an expression form – whether paper or electronic one: 1) document type 2) document classification 3) document title 4) table of contents

№	Attribute type	Mandatory yes/no	Description/comments
			5) document body (mandatory) 6) annexes Herewith, information integrity and authenticity are to be assured when processing, storing and transferring.
2.	Document issuer legal status	yes	An aggregate of the following attributes is the <i>document issuer legal status</i> : 1) logotype 2) name of a issuer 3) issuer reference data (address, contacts etc.) 4) seal impression It can be performed through constituting of an authorized body that provides electronic register assuring the attribute validity property. or For electronic seals it can be fixed with a special attribute in electronic seal certificate.
3.	Signatory status (powers) or signatory position	yes/no	Can be performed through forming of an electronic register of authorized persons or roles, containing a brief description of powers with their duration stated. or Can be fixed with a special attribute in electronic signature certificate.
4.	Signature	yes	An aggregate of the following attributes is the <i>signature</i> : 1) issuer's signature 2) signature stamp of confirmation 3) signature stamp of approval 4) visa (clearance / endorsement stamp) 5) copy certification stamp 6) electronic seal of issuing organization 7) etc.  Can be performed through using of an electronic signature (for natural persons) and/or electronic seal (for legal entities). Note: The form of the relationship between the signatory and the document content ( negotiation, approval, visa, copy legalization, etc.) can be stated in a document body, included to an electronic signature/seal or reflected in metadata to a record in an electronic data base.
5.	Time	yes	A statement of the time point of signing, attached on the basis of a trusted time source (the validity aspect).
6.	Place	no	A statement of the place of signing (the place where Signatory expressed his/her will to sign by triggering signing) is optional. There would be at least a theoretical opportunity for TSPs for offering – similarly to the time stamp service - a 'place stamp service' based on a trusted geo position source (e.g. a global navigation satellite system (GNSS)).

№	Attribute type	Mandatory yes/no	Description/comments
			If this type of service is not available the attribute <i>place</i> can be considered as one of the <i>content</i> attributes.

282 **Table 1: document's attributes needed for providing document's legal function**  
283 **fulfillment**

284 Documents attributes above can be verified by trust services of different types.

285 Basic trust services types (trust services functions provided dependent on concrete demand)  
286 are:

287 a) Creation, verification, and validation of electronic signatures and seals.

288 b) Monitoring of legal status.

289 c) Creation, verification, and validation of electronic time stamps.

290 d) Providing neutral inter-domain gateways (nIDG).

291 If there is a gateway between domains (jurisdictions), there should be a profile for this nIDG  
292 based on agreement between these domains. Each nIDG profile should "know" what  
293 attributes are mandatory for each domain. On the technological level, a nIDG shall implement  
294 some protocol translation or translation of different protocols or standards from one domain to  
295 another. For mathematical description of nIDG functions please refer to ANNEX 2. Trust  
296 services (incl. nIDGs) work with national identification schemes on the one hand and with  
297 international trust infrastructure (other trust services) on the other.

298 e) Providing identification of natural or legal persons.

299 The following attribute types (see Table 1) presume a previously performed identification of  
300 related natural or legal persons:

301 - document issuer legal status;

302 - signatory status (powers) or signatory position;

303 - signature.

304 The trust service types a) and b) use these attribute types and, hence, also presume a  
305 previously performed identification of related natural or legal persons. The identification  
306 services are provided by operators specialized in performing identification. These services can  
307 be implemented on different qualification levels: zero, basic and high. The ICC shall  
308 decide/agree on eligible identification schemes including minimal requirements on them.  
309 There may be ICC own identification schemes and/or references to international standards  
310 and/or references to the notified identification schemes inside the single trust domains.

311 Sets of identification attributes and identification procedures themselves can serve as the basis  
312 for the definition of the qualification levels of identification schemes. The qualification levels  
313 of identification schemes can be of essence for the regulation of interaction between different  
314 trust domains. Sets of identification attributes can be defined by the legal regimes for the  
315 business activity of operators specialized in performing identification and of functional  
316 operators. Sets of identification attributes can be maintained by the trust services  
317 (identification service). The activity of operators specialized in performing identification can  
318 be regulated by special organizational and technical requirements directed, besides others, on  
319 personal data protection.

320 *Note. Long time archival and related verification service can be realized as a function of ICT*  
 321 *service or as a function of a special trust service type.*

322 **2.5. Trust infrastructures services levels of qualification**

323 The level of qualification of a trust service is a property of the trust service to evidently fulfill  
 324 a pre-defined set of requirements on it. There may be different incremental qualification  
 325 levels of a trust service. The lower is the *degree of confidence* of the participants in each other  
 326 and in the ICT services processing *electronic interaction* (creation, access, transformation,  
 327 transmission, destruction, etc.), the higher might be demand on the qualification level of trust  
 328 services.

329 The characteristics of the levels of qualification of trust services are described in the  
 330 following table.

Degree of confidence of participants in each other and in the ICT services	High degree of confidence	Substantial degree of confidence	Limited degree of confidence
levels of qualification of trust services	No trust services required ('zero' level of qualification)	<b>Basic level of qualification</b>	<b>High level of qualification</b>
legal regime of operation of trust services	n.a.	Based on commercial agreements and/or common trade practice.	Based on international agreements (conventions) and/or on directly applicable international regulation <sup>4</sup> .
Organizational architecture of trust services	n.a.	Large Scale Projects of any kind.	International Coordination Council (ICC), see sec. 2.3 above
Technological requirements on trust services	n.a.	Meet the recognized best practices for TSPs.	– Meet ICC Compliance Criteria AND – Meet the requirements laid down in the applicable national regulation (for national TSPs).

331 **Table 2: characteristics of the levels of qualification of trust services**

332 If trust services engaged in document lifecycle (incl. chain of nIDGs between the document's  
 333 issuer and recipient) have different levels of qualification, the overall level of qualification is  
 334 equal to the lowest of them.

335 **2.6. Communication with organizations in different areas of standardization**

336 *Identification of international organizations in different areas of normative and legal*  
 337 *regulation and policies (such as WTO, UNCITRAL, WCO and others) for participation in the*  
 338 *defining conditions for establishing necessary level of trust between the participants of the*  
 339 *trusted infrastructure that will ensure legal significance of transboundary electronic*  
 340 *exchange of data issued in different jurisdictions.*

---

<sup>4</sup> E.g. trust services that operates in accordance with European Regulation (eIDAS) or Eurasian Economic Union Agreement and other documents.

341 *Identification of international organizations in different areas of standardization (such as*  
342 *ISO, W3C, ETSI and others) for participation in all the technical aspects of forming and*  
343 *functioning transboundary trust space.*

Примечание [s1]: From the  
project proposal

#### 344 **Communication with UNCITRAL on legal regulation**

345 1) It is recommended to give a description of different possible legal regimes:

- 346 – based on international agreements (conventions) and/or on directly applicable  
347 international regulation;
- 348 – based on commercial agreements and/or common trade practice;
- 349 – without special international regulation.

350 Legal regimes can be additionally supported by traditional institutes (governmental  
351 authorities, judicial settlement, risk insurances, notary ship and others) through mutual  
352 recognition of electronic documents secured by trust services.

353 Established legal regimes can also provide for imposing special requirements on the material  
354 and financial support of the business activity of specialized operators in case of damage to  
355 their users, including cases of compromising personal data.

356 Issues of institutional guarantees and legal regimes for constituting and functioning regional  
357 and global TTS-domains are proposed to be considered in a separate UNCITRAL  
358 Recommendation.

359 2) It is recommended to describe the mechanisms of interaction of particular states and their  
360 international unions with other international formats in the frames of constituting of a  
361 common TTS:

362 2.1) By means of the complete or a partial joining a state to an existing legal regime on the  
363 basis of international treaties and/or directly applicable international regulations, in which  
364 frames a task on forming a regional TTS has already been set or solved. This existing legal  
365 regime ensures institutional guarantees to the subjects of electronic interaction.

366 2.2) On the basis of interaction between different international unions:

- 367 – in the first stage, a group of states creates an regional TTS domain ensuring institutional  
368 guarantees for the subjects of electronic interaction within the legal regime specified by  
369 these states;
- 370 – in the second stage, the protocols of trusted interaction with other international unions are  
371 specified as related to mutual recognition of different legal regimes. This mutual  
372 recognition shall regard to institutional guarantees and information security requirements  
373 appertaining to each of the international formats, possibly on the basis of a nIDG being  
374 operated in the frames of an international legal regime.

375 2.3) On the basis of interaction of a state with other states or international unions:

- 376 – in the first stage, a state creates its own trust domain functioning in the frames of national  
377 legal regime specified by this state;
- 378 – in the second stage, the protocols of trusted interaction with other states and/or  
379 international unions are specified as related to mutual recognition of different legal  
380 regimes. This mutual recognition shall regard to institutional guarantees and information  
381 security requirements appertaining to these states and international formats, possibly on  
382 the basis of a nIDG being operated in the frames of an international legal regime.

383 3) It is recommended to describe domain-constituting mechanisms, similar to item 2), for  
384 legal regimes based on commercial agreements and/or common trade practice.

385 **Communication with international organizations in different areas of standardization**  
386 **on technical and organizational aspects of forming and functioning transboundary trust**  
387 **space**

388 It is recommended to take into consideration the following aspects of standardization:

389 1. Technical and technological aspect

390 The main objective of standardization in this area is facilitating technical interoperability  
391 within the transboundary trust space. This should cover all technical aspects that necessarily  
392 impact functional and security interoperability like documents and data formats,  
393 communication protocols, format and protocol conversions, technical interfaces, the  
394 equivalence of the assurance (security) level of technical components, etc.

395 2. Organizational aspect

396 The main objective of standardization in this area is supporting a level of trust between trust  
397 domains being sufficient for a mutual recognition (legalisation) of electronic documents and  
398 data, which are issued in different domains or jurisdictions. This includes, but is not limited  
399 to, procedures in respect of performing conformity audits of trust service providers by  
400 independent conformity assessment bodies, of accrediting these conformity assessment  
401 bodies, of mutual “peer-to-peer” audits between the members of the International  
402 Coordination Council, objects and areas subjected to the audits and the applicable audit  
403 criteria.

404 **ANNEX 1**

405 Mathematical description of nIDG functions

- 406     ○ The set of rules to translate the related requirements between two domains A and B  
407     should be laid down within nIDG

408      $A := \{a_1, a_2, \dots, a_N\}$

409      $B := \{b_1, b_2, \dots, b_M\}$

410      $E(a) := A \rightarrow B$

411     *Where A is the set of requirements (attributes) for domain A, B – the set of*  
412     *requirements for domain B and E(a) is the set of transformation rules from A to B.*  
413     *Taking in mind that powers of sets (i.e. quantity of requirements in a real word) can*  
414     *be not equal ( $N \neq M$ ), there should be rules defined to lead both sets to equal power*  
415     *K where  $K := \text{MAX}(N, M)$ .*

- 416     ○ The degree of trust to such set of transformation rules can be defined as transformation  
417     to some universal superset of requirements, and such transformation is performed  
418     inside each domain.

419      $E(a) := A \rightarrow X$

420      $E(x) := X \rightarrow B$

421     Where X is universal superset of requirements for A and B.
