CENTRE FOR TRADE FACILITATION AND ELECTRONIC BUSINESS
(UN/CEFACT)

REGULATORY PROGRAMME DEVELOPMENT AREA
E-GOVERNMENT DOMAIN

Ensuring legally significant trusted trans-boundary electronic interaction

DRAFT

SOURCE: Project Team

ACTION: Version prepared by Bureau to be suggested as a White Paper

DATE: 16 October 2017

STATUS: Draft v0.98

Disclaimer (Updated UN/CEFACT Intellectual Property Rights Policy – ECE/TRADE/C/CEFACT/2010/20/Rev.2)

ECE draws attention to the possibility that the practice or implementation of its outputs (which include but are not limited to Recommendations, norms, standards, guidelines and technical specifications) may involve the use of a claimed intellectual property right.

Each output is based on the contributions of participants in the UN/CEFACT process, who have agreed to waive enforcement of their intellectual property rights pursuant to the UN/CEFACT IPR Policy (document ECE/TRADE/C/CEFACT/2010/20/Rev.2 available at http://www.unece.org/cefact/cf_docs.html or from the ECE secretariat). ECE takes no position concerning the evidence, validity or applicability of any claimed intellectual property right or any other right that might be claimed by any third parties related to the implementation of its outputs. ECE makes no representation that it has made any investigation or effort to evaluate any such rights.

Implementers of UN/CEFACT outputs are cautioned that any third-party intellectual property rights claims related to their use of a UN/CEFACT output will be their responsibility and are urged to ensure that their use of UN/CEFACT outputs does not infringe on an intellectual property right of a third party.

ECE does not accept any liability for any possible infringement of a claimed intellectual property right or any other right that might be claimed to relate to the implementation of any of its outputs.

2 Foreword

3 ~~This Recommendation is intended to help facilitate and encourage constituting a transboundary~~
4 ~~trusted environment for the international *legally significant*¹ exchange of electronic documents and~~
5 ~~data between public authorities, natural and/or legal persons. This Recommendation may attract~~
6 ~~attention of an audience that is involved/interested in the establishment and operation as well as in~~
7 ~~the practical usage of such transboundary infrastructures.~~

8 ~~Executive summary~~

9 ~~The UN Centre for Trade Facilitation and e-Business (UN/CEFACT) is engaged to provide guidance and~~
10 ~~electronic business standards to streamline processes. This encompasses electronic data exchanges~~
11 ~~between parties (private sector and/or public sector). Though UN/CEFACT strives to remove burdens~~
12 ~~for traders, which includes the removal of all forms of authentication when it is not pertinent to the~~
13 ~~content of the exchange or the relationship between the actors, it also does recognize the need for~~
14 ~~higher levels of securisation in certain electronic exchanges. Such higher levels of securisation should~~
15 ~~be justifiable in each case and certainly not generalized to all exchanges.~~

16 ~~To achieve this purpose, UN/CEFACT develops recommendations, white papers, green papers,~~
17 ~~guidelines and other guidance material. Together with UNECE Recommendation 14 on the~~
18 ~~Authentication of Trade Documents, the current white paper is proposed to satisfy the needs of~~
19 ~~businesses and governments when higher levels of reliability are required.~~

20 ~~This paper is intended to help facilitate and encourage constituting a transboundary trusted~~
21 ~~environment for the international *legally significant*² exchange of electronic documents and data~~
22 ~~between public authorities, natural and/or legal persons. This paper may attract attention of an~~
23 ~~audience that is involved/interested in the establishment and operation as well as in the practical~~
24 ~~usage of such transboundary infrastructures.~~

25

26 ~~To be written by the UNECE Secretariat.~~

27

46

47

48 I. Introduction

49 The Internet has become a habitual tool and environment for obtaining electronic services for
50 individuals and entities of various states. The advantages of such services are evident, but there ~~is~~
51 ~~are~~ a number of organizational and legal issues preventing their wide usage in those activity areas
52 where users need a certain *degree of confidence* in each other and in electronic services they use.
53 One of the main issues is ensuring the *legal validity* of e-documents and the *legal significance* of
54 electronic interaction in general. This problem is urgent on both the national level – within single
55 jurisdictions, and the transboundary one – by interaction of participants acting under jurisdictions of
56 different states.

57 The following scenarios represent some examples where a certain *degree of confidence* is required:

- 58 • Electronic tendering procedures, especially the cases when the contracting authority is a
59 governmental body or a big company. These contracting authorities ~~lay~~ usually ~~lay~~ down a
60 higher level of requirements for economic operators' trade documents validity verification.
- 61 • ~~Certain t~~Trade and transport documents exchanged ~~d~~ within cross-border trade procedures.
- 62 • Dispute resolution and settlement procedures including on-line dispute resolution. These
63 procedures require a univocal identification and authentication of a plaintiff and defendant.
- 64 • Electronic insurance. There should be a mechanism for a reliable verification of an insurance
65 certificate.

66 The urgency of establishing national environments for paperless trade is mentioned in some regional
67 arrangements for the facilitation of cross-border paperless trade such as the Agreement on
68 Facilitation of Cross-border Paperless Trade in Asia and the Pacific issued by ESCAP. One of the
69 purposes of this ~~Recommendation-white paper~~ is to support governments, regional and international
70 organizations in building up and managing these environments in an interoperable way.

71 UN/CEFACT recognizes the aim of removing any additional rulings, contracts or practices for
72 facilitation of international trade procedures when possible. In particular, it is stated in ~~the~~
73 Recommendation 14. Nevertheless, there are still sufficient trade related scenarios whose
74 participants seek ~~for~~ a high *degree of confidence* in each other. The current ~~white paper~~
75 ~~Recommendation~~ facilitates the implementation of exactly such scenarios.

76 ~~Part one: Recommendation No _____ : Recommendation for ensuring~~ 77 ~~legally significant trusted trans-boundary electronic interaction~~

78 ~~I. Scope~~

79 This ~~Recommendation-white paper explores seeks to encourage the use of electronic data transfer in~~
80 ~~international trade scenarios which require a high degree of confidence in counterparts by~~
81 ~~recommending to Governments~~ the principles of establishing and operating regional and global
82 coordination organizations for ensuring trust in international exchange of data and electronic
83 documents between participants (entirety of public authorities, natural and legal persons interacting
84 within relations arising from electronic interaction).

85 This ~~Recommendation-white paper~~ covers mainly organizational and partially technical provisions
86 concerning trusted information and communication technologies (hereafter ICT) services. Provisions
87 regarding establishing appropriate legal regimes may be elaborated by ~~otherspecialized-UN~~ bodies
88 ~~(such as UNCITRAL).~~

89 The general purpose of this ~~Recommendation-white paper~~ is to help ensure the rights and legal
90 interests of citizens and organizations ~~under the jurisdiction of United Nations Member States~~ while

91 performing *legally significant*³ information transactions in electronic form using the Internet and
92 other open ICT systems of mass usage ~~and operating within the context of a *Common Trust*~~
93 ~~*Infrastructure*.~~

94 ~~II. Benefits~~

95 ~~Harmonized regional and global coordination based on common principles will provide a smooth,~~
96 ~~transparent and reliable environment for electronic activities in transboundary trade scenarios. This~~
97 ~~will help to facilitate attaching *legal significance* to an electronic interaction between legal entities~~
98 ~~and other economic operators regardless of their location and jurisdiction.⁴~~

99 ~~III. Use of International Standards~~

100 ~~The use of international standards can play a key role in larger acceptance of chosen solutions and~~
101 ~~eventually interoperability. Insofar as possible, all actors, who intend to use electronic data transfer~~
102 ~~in international trade scenarios, should try to make use of existing international standards.~~

103 ~~IV. Recommendation~~

104 ~~In order to achieve UN/CEFACT recommends to governments and entities engaged in the~~
105 ~~international trade and movement of goods, providing services and payment processing and seeking~~
106 a higher *degree of confidence* in electronic interaction, ~~this white paper explores~~ establishing a
107 *Common Trust Infrastructure* (hereinafter *CTI*) - a fundamental, easily scalable platform that includes
108 dedicated trusted ICT services and provides a unified access to these services.

109 ~~In order to achieve this objective, UN/CEFACT recommends:~~

- 110 ~~● CTI establishment principles;~~
- 111 ~~● CTI coordination approaches;~~
- 112 ~~● approaches ensuring technical interoperability of CTI services;~~
- 113 ~~● levels of trust provided by CTI;~~
- 114 ~~● standardization organizations to co-operate with.~~

115 UN/CEFACT recognizes the technological neutrality principle and does not propose any specific
116 technology as a basis for *CTI*. It is up to governments to choose the technologies which will provide
117 the necessary *degree of confidence* in the electronic interaction. ~~UN/CEFACT~~ ~~this white paper~~ focuses
118 on organizational aspects of *CTI* and elaborates technical issues merely to ~~the~~ extent ~~td~~ necessary for
119 making the ~~recommended~~ approaches applicable in practice.

120 ~~Part 2: Guidelines on how to implement the Recommendation~~__

121 ~~II. Basic principle of Common Trust Infrastructure~~ Introduction

122 Participants in electronic interactions typically deal with some kind of ICT services (email, cloud
123 storages, web-portals etc.). If such participants already have a sufficient *degree of confidence* in each
124 other and in ICT services they use, then nothing ~~is~~ ~~needs~~ to be changed. But if the participants are
125 not sufficiently confident in each other and/or in the ICT services they are using, then it may be
126 appropriate to use a trusted third party to help increase the *degree of confidence* in the electronic
127 interaction on the whole. The services provided by these trusted third parties are called *trust services*.

³ ~~Note that attaching the attribute “legal significance” to an electronic interaction will require a legal framework that is separate from and in addition to this white paper.~~

⁴ ~~Note that attaching the attribute “legal significance” to an electronic interaction will require a legal framework that is separate from and in addition to this Recommendation.~~

128 | ~~Under this Recommendation~~ Within this white paper, trust services may be of different types (i.e.
129 provide different functions) and of different *levels of qualification*. High level qualification trust
130 services are operated under one or more international agreements, and they meet the requirements
131 and follow the rules laid down by international coordinators. Basic level qualification trust services
132 are operated under one or more commercial agreements, and they may be established within, for
133 example, some large scale international projects and follow the recognized best practices for trust
134 service providers. Trust services should be audited in accordance with their *level of qualification*.

135 The aggregate of trust services operating within the legal, organizational and technical framework
136 forms the *Common Trust Infrastructure*. The CTI is a fundamental, easily scalable infrastructural
137 platform providing a unified access to trust services.

138 The existing natural peculiarities (historical, cultural, political, economic, technical, etc.) of different
139 world regions may result in different *levels of trust* within these regions concerning electronic
140 interactions.

141 The primary objective of a CTI is helping to ensure *legally significant* electronic interactions between
142 its users by providing trust services of different *qualifications* (zero, basic, high) to the participants of
143 electronic interaction.

144 This institutional guarantee is proposed to be ensured within business activity of specialized
145 providers which:

- 146 • provide users with a set of trusted ICT services;
- 147 • operate within established legal regimes, which include but are not limited to restrictions
148 imposed by processing of personal data; and
- 149 • operate within the context of a *Common Trust Infrastructure*.

150 | III. *Common Trust Infrastructure* establishment principles

- 151 • **Scalability.** The CTI should be established in such a way that it can be easily scaled. It
152 broadens easily at any level of consideration due to the accession of new participants, such
153 as new jurisdictions, new supranational participants, new providers of trust services, and
154 register systems.
- 155 • **Traceability.** If required by the participants of electronic interaction, ~~Any any~~ fact of
156 electronic interaction within the CTI should be recorded and available for conflict resolutions
157 if necessary.
- 158 • **Cost efficiency.** While making decision on a concrete variant of the CTI architecture, variants
159 (~~varies?~~) comparison of the risk analysis should be taken into account. The CTI forming and
160 functioning costs should be lower than possible losses caused by ICT-specified malfunctions
161 and malicious activities.
- 162 • **Complexity.** Coherent elaboration of legal, organizational and technological issues should be
163 done within CTI establishment. A complex description allows correct functioning of the
164 system as a whole and its single elements.

165 | IV. *Common Trust Infrastructures* coordination approaches

166 The CTI architecture is selected according to the [principals principles](#) stated in [the previous](#)
167 [section Part two, chap. II above](#). There are three levels of CTI coordination: legal, organizational and
168 technological.

169 | Legal level

170 The CTI can be built on a single- or multi-domain basis. In the context of legal and organizational
171 regulation, the multi-domain basis is the most complicated variant. Fig. 1 gives a general scheme of a
172 possible approach to legal regulation.

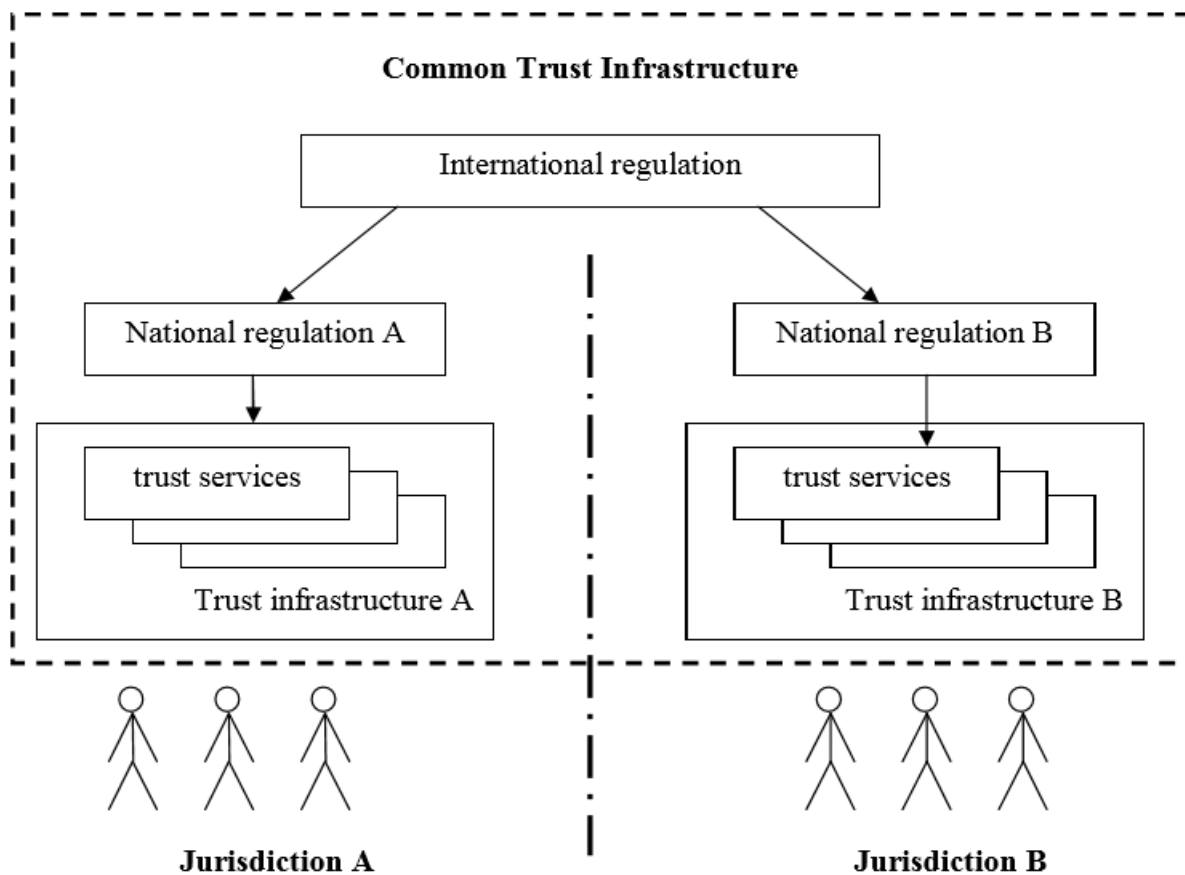

FIG.1. LEGAL LEVEL

173

174

175 Legal regulation of CTI interaction can be divided in two parts: international and national. The
 176 international legal regulation is carried out on the basis of the following types of documents:

- 177 • international treaties/agreements;
 178 • acts of different international organizations;
 179 • international standards and regulations;
 180 • agreements between participants of transboundary electronic interaction on given issues;
 181 • model acts.

182 The national legal regulation is built on a complex of normative documents that are standard in each
 183 particular jurisdiction.

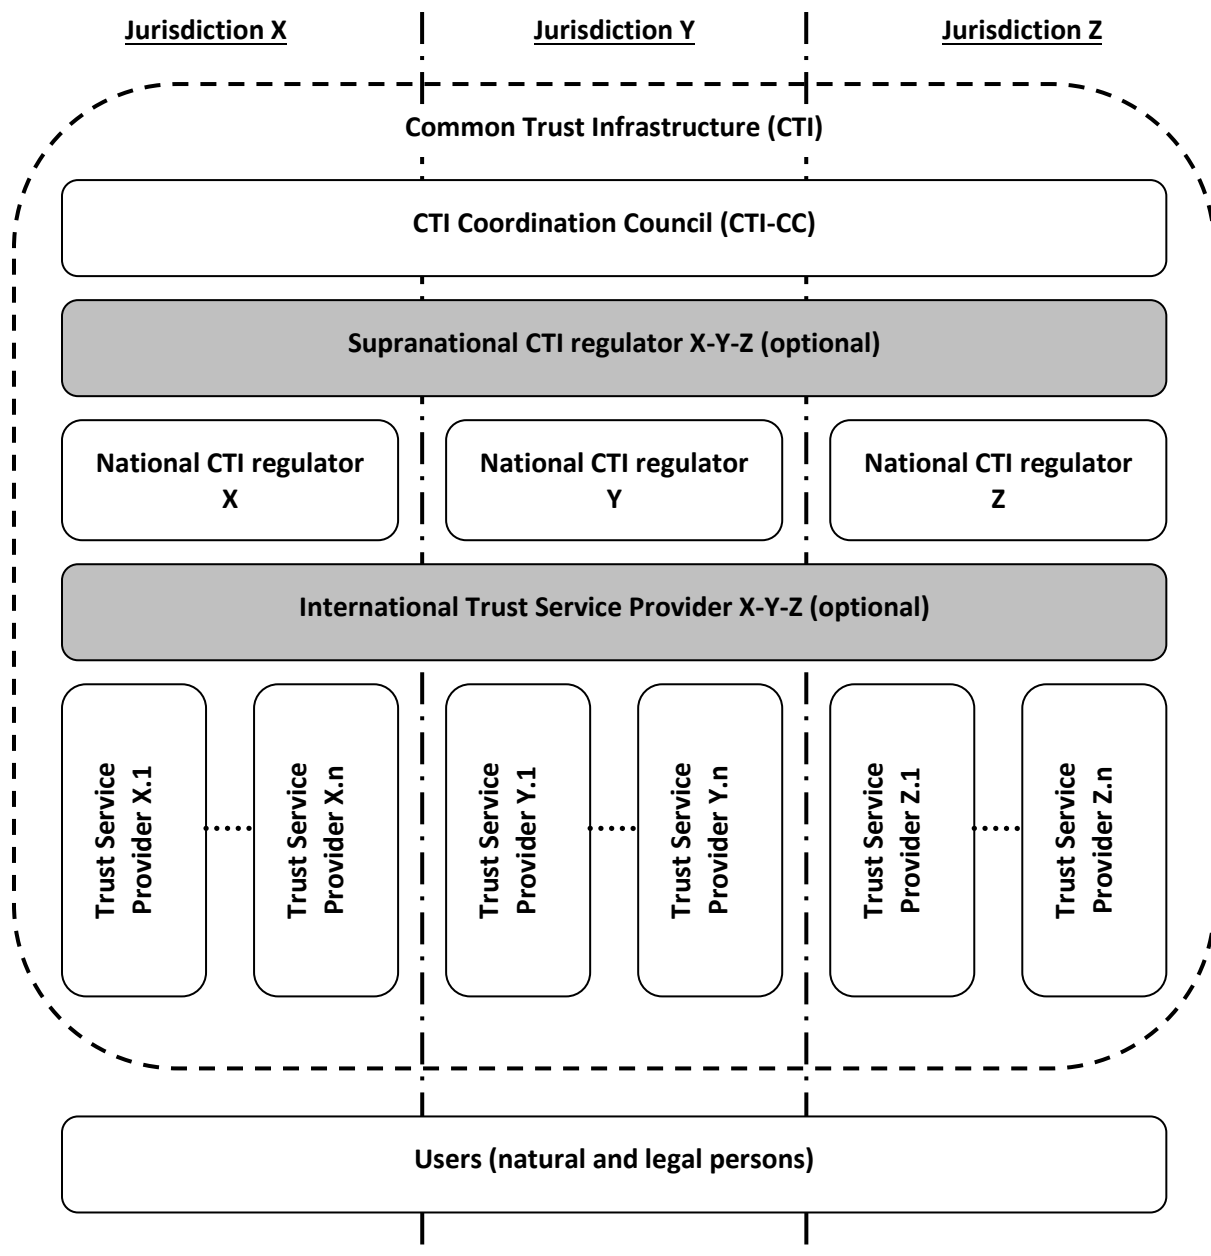

184 ~~We recommend a tight cooperation with UN bodies specialized in legal frameworks elaboration (such~~
 185 ~~as UNCITRAL) in order to harmonize the effort of this Recommendation concerning the necessary~~
 186 ~~coordination on the legal level, see Part two, chap. VI.~~

187

188 **Organizational level**

189 Mutual *legally significant* recognition of electronic documents and data treated by *trust services*
 190 provided under various jurisdictions ~~could be is-~~reached through creation and operation of a
 191 dedicated body (let's call it ~~international a CTI~~ Coordination Council or CTI-CC) that includes national
 192 regulation bodies having voluntarily joined ~~ed~~ the CTI-CC. The activity of CTI-CC ~~could be is~~ regulated
 193 by ~~the a CTI-~~CC Statute which ~~could should is to-~~be recognized and signed by all its authorized
 194 members – that is the Regulation Bodies of the Electronic Data Exchange represented primarily by
 195 the National CTI Regulators. Fig. 2 gives a general scheme of the organizational level of coordination.

196

197
198 **Fig.2. Organizational level (optional elements are identified by the grey blocks)**

199 The ~~ICCTI-CC~~ issues a number of documents interconnected with its Statute:

- 200
- 201 • **Requirements** for the ~~ICCTI-CC~~ members, correspondence to which is a prerequisite for the full membership in the ~~ICCTI-CC~~;
 - 202 • **Guidelines** on carrying out 'shadow' supervision for admittance to the ~~ICCTI-CC~~ and periodic mutual audit for maintaining voluntary membership in the ~~ICCTI-CC~~;
 - 203 • **Compliance criteria** which are to be met by providers of the *trust services*, and the methodology for applying these criteria;
 - 204 • **Scheme of estimation/verification** of providers of the *trust services* with respect to their meeting these criteria.
- 205
206
207

208 In the *CTI*, each jurisdiction is represented by the National *CTI* regulator (see Fig. 2, National *CTI* regulators X, Y, Z) which regulates the activity of providers of the *trust services* within its jurisdiction.

210 For groups of states with high degree of integration (for example, Eurasian Economic Union member-states or European Union member-states) there is the possibility of constituting a Supranational *CTI*

211

212 regulator (see. Fig. 2, Supranational *CTI* regulator X-Y-Z). In such case, one Supranational *CTI*
213 regulator X-Y-Z substitutes a group of National *CTI* regulators X, Y and Z.

214 The natural *CTI* scalability is enabled through the procedure for admitting new members to the
215 ~~ICECTI-CC~~ (new national and supranational participants) and the scheme for verifying that the
216 providers of the *trust services* meet the *Compliance criteria* issued by the ~~ICECTI-CC~~ (new providers of
217 the *trust services*).

218 International providers of the *trust services* can provide, inter alia, neutral inter-domain gateways as
219 a specific type of *trust services*. The main function of an inter-domain gateway is providing a mutual
220 recognition (legalisation) of electronic documents and data. These inter-domain gateways connecting
221 single *domains* represent the elements of building a *CTI*.

222 Inter-domain gateways can be established both: at only legal and organizational levels and at a
223 complex level: legal, organizational and technical one.

224 In the first case, the communicating *domains* establish a common legal basis for the cooperation
225 between them, see sec. 'Legal level' above. This legal basis defines a full set of the requirements,
226 conditions and prerequisites enabling and even guaranteeing a mutual legal recognition (legalisation)
227 of *legally significant* electronic documents as such.

228 On the organizational level, procedures and processes of interaction between different *domains* shall
229 uphold the *level of trust* between these *domains* being sufficient for a mutual recognition
230 (legalisation) of electronic documents and data, which are issued in different *domains* or jurisdictions.

231 In order to achieve this necessary *level of trust*, this set of the requirements, conditions and
232 prerequisites shall regulate, inter alia, the establishment and operation of a neutral international
233 environment, i.e. of an environment outside (beyond) any single *domain*. The ~~ICECTI-CC~~ and
234 International *trust service* providers represent parts of this neutral international environment. Such a
235 neutral international environment ~~could~~ be operated in a neutral legal field that is defined by an
236 international body, for example, by a UN Convention or by an international treaty between single
237 countries or unions of countries, see sec. 'Legal level' above.

238 I.e. in the case, when inter-domain gateways are established at only legal and organizational levels,
239 these inter-domain gateways are implemented merely by treaties, agreements and organizational
240 procedures. This legal and organizational infrastructure may be supported by different single *trust*
241 *services* like e-signature verification, powers verification, time stamping etc., but without a specific
242 *trust service* dedicated to the purpose to be a gateway.

243 In the second case, when inter-domain gateways are established at legal, organizational and
244 technical levels, inter-domain gateways additionally transform a document in such a way that it will
245 fulfill the requirements (attributes, format, structure, etc.) for *legally significant* electronic
246 documents in recipient's *domain*⁵ (jurisdiction). In such a way the inter-domain gateway *trust service*
247 can substitute a number of *trust services* that provide only single specific functions (e-signature
248 verification, powers verification, time stamping etc.). As ever, even technically implemented inter-
249 domain gateway *trust service* shall also be operated in a neutral international environment.

250 Approaches to forming inter-domain gateways should regard usage of transition profiles describing
251 and configuring transitions from one *domain* to another. These transition profiles should consider,
252 inter alia, the legal basis of the cooperation between the communicating *domains* and the *levels of*
253 *qualification* of the identification schemes used inside the interacting *domains*, as well.

254 In order to become a National Trust Service Provider, a supplier of the respective services ~~shall~~
255 should undergo accreditation with the National *CTI* regulator of the same jurisdiction. International

⁵ 'Domain' or 'trust domain' can coincide with a single jurisdiction or can unite several jurisdictions

256 Trust Service Providers ~~shall~~ should undergo accreditation with the ~~ICCTI-CC~~. The requirements for
 257 accreditation of the providers of the *trust services*, as well as the requirements to their activity ~~are~~
 258 should be regulated by the *Compliance criteria* issued by the ~~ICCTI-CC~~ and possible national
 259 supplements issued by the respective National *CTI* regulator.

260 In the ~~ICCTI-CC~~, the users of electronic services ~~can~~ could be both individuals and legal entities.
 261 The users select the necessary *level of qualification* of a *trust service* at their discretion or in an
 262 agreement.

263 The services ~~are~~ could ~~should be~~ provided by the respective suppliers – the *trust service* providers.
 264 The *trust service* providers ~~are~~ could ~~should be~~ integrated by the *CTI*.

265 The *trust services* as the *CTI* elements ~~can~~ could have different variants of realization depending on
 266 the *level of trust* between *domains* (jurisdictions). For example, with conditionally ‘high’ or ‘medium’
 267 level of mutual trust between the *CTI* members, it is efficient to use centralized International *trust*
 268 *services* applied according to the standards agreed upon. In case of conditionally ‘low’ *level of trust*,
 269 the *trust services* are built according to the decentralized principle – national *trust services* in each
 270 single jurisdiction.

271 Technological level

272 There can be a great number of technological options for *trust services*’ realization. The main
 273 requirement to the *CTI* elements is interoperability. Regulation at this level is carried out with
 274 application of different standards and instructions set forth by the ~~ICCTI-CC~~ documents.

275 ~~We~~ This white paper recommends a tight cooperation with major organizations in the area of
 276 technical standardization such as ISO, ETSI, W3C, CEN and others in order to harmonize the effort of
 277 this Recommendation paper concerning the necessary coordination on the technological level, ~~see~~
 278 Part two, chap. VI.

279 IV. Trust infrastructures services technical interoperability ensuring approaches

280 To work out *trust services* types it is proposed to consider base document’s attributes that are
 281 usually necessary to provide document’s legal function fulfillment.

No	Attribute type	Mandatory yes/no	Description / comments
1.	Content	yes	<p>An aggregate of at least one of the following attributes is the <u>content</u>, the informational essence of a document, which is to be irrespective to <u>of</u> an expression form – whether paper or electronic one:</p> <ol style="list-style-type: none"> 1) document type 2) document classification 3) document title 4) table of contents 5) document body (mandatory) 6) annexes <p>Herewith, information integrity and authenticity are to be assured when processing, storing and transferring.</p>
2.	Document issuer legal status	yes	<p>An aggregate of the following attributes is the <u>document issuer legal status</u>:</p> <ol style="list-style-type: none"> 1) logo type 2) name of <u>an</u> issuer 3) issuer reference data (address, contacts etc.)

			4) seal impression
3.	Signatory status (powers) or signatory position	no	A brief description of signatory powers with their duration stated.
4.	Signature	yes	An aggregate of the following attributes is the <u>signature</u> : 1) issuer's signature 2) signature stamp of confirmation 3) signature stamp of approval 4) visa (clearance / endorsement stamp) 5) copy certification stamp 6) seal of issuing organization 7) etc.
5.	Time	yes	A statement of the time point of signing, attached on the basis of a trusted time source (the validity aspect).
6.	Place	no	A statement of the place of signing (the place where Signatory expressed his/her will to sign by triggering signing) is optional. If this type of service is not available the attribute <u>place</u> can be considered as one of the <u>content</u> attributes.

282 **Table 1: document's attributes needed for providing document's legal function fulfillment**

283 Document's attributes above can be verified by *trust services* of different types.

284 Basic *trust services* types (trust services functions provided dependent on concrete demand) are:

- 285 a) Creation, verification, and validation of signatures and seals.
286 b) Monitoring of legal status.
287 c) Creation, verification, and validation of time stamps.
288 d) Providing neutral inter-domain gateways.

289 If there is a gateway between *domains* (jurisdictions), there should be a profile for this inter-
290 domain gateway based on agreement between these *domains*. Each inter-domain gateway
291 profile should "know" what attributes are mandatory for each *domain*. On the technological
292 level, an inter-domain gateway ~~shall~~ could ~~should~~ implement some protocol translation or
293 translation of different protocols or standards from one *domain* to another. For the
294 mathematical description of inter-domain gateway functions please refer to ANNEX 12. *Trust*
295 *services* (incl. inter-domain gateways) work with national identification schemes on the one
296 hand and with international trust infrastructure (other *trust services*) on the other.

- 297 e) Providing identification of natural ~~or~~ and legal persons.

298 The following attribute types (see Table 1) presume a previously performed identification of related
299 natural or legal persons:

- 300 • document issuer legal status;
301 • signatory status (powers) or signatory position;
302 • signature.

303 The *trust service* types a) and b) use these attribute types and, hence, also presume a previously
 304 performed identification of related natural or legal persons. The identification services are provided
 305 by providers specialized in performing identification. These services can be implemented on different
 306 *qualification levels*: zero, basic and high. The ~~ICCCTI-CC~~ shall decide/agree on eligible identification
 307 schemes including minimal requirements on them. There may be ~~ICCCTI-CC~~ own identification
 308 schemes and/or references to international standards and/or references to the notified identification
 309 schemes inside the single *domain*.

310 Sets of identification attributes and identification procedures themselves can serve as the basis for
 311 the definition of the *qualification levels* of identification schemes. The *qualification levels* of
 312 identification schemes can be of essence for the regulation of interaction between different *domains*.
 313 Sets of identification attributes can be defined by the legal regimes for the business activity of
 314 providers specialized in performing identification and of functional providers. Sets of identification
 315 attributes can be maintained by the *trust services* (identification service). The activity of providers
 316 specialized in performing identification can be regulated by special organizational and technical
 317 requirements directed, besides others, on personal data protection.

318 Note. Long time archival and related verification service can be realized as a function of ICT service or
 319 as a function of a special trust service type.

320 Note. The existing electronic systems should be taken into account; so the requirements on their
 321 updating for connecting to the *CTI* may be minimal.

322 VI. Common Trust Infrastructures services levels of qualification

323 The *level of qualification* of a *trust service* is a property of the trust service to evidently fulfill a pre-
 324 defined set of requirements on it.

325 There may be different incremental *qualification levels* of a *trust service*. The lower is the degree of
 326 confidence of the participants in each other and in the ICT services processing electronic interaction
 327 (creation, access, transformation, transmission, destruction, etc.), the higher might be demanded
 328 on the *qualification level* of *trust services*.

329 The characteristics of the *levels of qualification* of *trust services* are described in the following table.

	Degree of confidence of participants in each other and in the ICT services		
	High degree of confidence	Substantial degree of confidence	Limited degree of confidence
levels of qualification of trust services	No trust services required ('zero' level of qualification)	Basic level of qualification	High level of qualification
legal regime of operation of trust services	n.a.	Based on commercial agreements and/or common trade practice-	Based on international agreements (conventions) and/or on directly applicable international regulation- ⁶
Organizational architecture of trust	n.a.	Large Scale Projects of any kind	CTI-International Coordination Council (ICCCTI-CC), see Part two, chap. Title IV# above

⁶ E.g. *trust services* ~~that operates~~ operated in accordance with ~~European~~ EU Regulation (eIDAS) or Eurasian Economic Union Agreement and other documents.

services			
Technological requirements on trust services	n.a.	Meet the recognized best practices for trust service providers-	-- Meet IECCTI-CC Compliance Criteria AND -- Meet the requirements laid down in the applicable national regulation (for national trust service providers)-

Table 2: characteristics of the levels of qualification of trust services

330

331 If *trust services* engaged in document lifecycle (incl. the chain of inter-domain gateways between the
332 document's issuer and recipient) have different *levels of qualification*, the overall *level of*
333 *qualification* is equal to the lowest of them.

334 VI. Communication with organizations in different areas of standardization

335 ~~Communication with UN bodies specialized on legal frameworks elaboration~~

336 1) ~~It is recommended~~This white paper suggests ~~to give~~ giving a description of different possible legal
337 regimes:

- 338 • based on international agreements (conventions) and/or on directly applicable international
339 regulation;
- 340 • based on commercial agreements and/or common trade practice;
- 341 • without special international regulation.

342 Legal regimes can be additionally supported by traditional institutes (governmental authorities,
343 judicial settlement, risk insurances, notary ship and others) through mutual recognition of electronic
344 documents secured by *trust services*.

345 Established legal regimes can also provide for imposing special requirements on the material and
346 financial support of the business activity of specialized providers in case of damage to their users,
347 including cases of compromising personal data.

348 Issues of institutional guarantees and legal regimes for constituting and functioning regional and
349 global transboundary trusted environment are proposed to be considered in a separate document by
350 a specialized ~~UN~~ body.

351 2) ~~It is recommended~~This paper suggests ~~to describe~~ describing the mechanisms of interaction of
352 particular states and their international unions with other international formats in the frames of
353 constituting ~~of~~ a common transboundary trusted environment:

354 2.1) By means of the complete or a partial joining ~~of~~ a state to an existing legal regime on the basis of
355 international treaties and/or directly applicable international regulations, in ~~the which~~ frames ~~of~~
356 ~~which~~ a task on forming a regional transboundary trusted environment has already been set or
357 solved. This existing legal regime ensures institutional guarantees to the subjects of electronic
358 interaction.

359 2.2) On the basis of interaction between different international unions:

- 360 • in the first stage, a group of states creates ~~a~~ regional domain ensuring institutional
361 guarantees for the subjects of electronic interaction within the legal regime specified by
362 these states;
- 363 • in the second stage, the protocols of trusted interaction with other international unions are
364 specified as related to mutual recognition of different legal regimes. This mutual recognition
365 shall regard to institutional guarantees and information security requirements appertaining

366 | to each of the international formats, possibly on the basis of an inter-domain gateway being
367 | operated in the frames of an international legal regime.

368 | 2.3) On the basis of interaction of a state with other states or international unions:

- 369 | • in the first stage, a state creates its own *domain* functioning in the frames of national legal
- 370 | regime specified by this state;
- 371 | • in the second stage, the protocols of trusted interaction with other states and/or
- 372 | international unions are specified as related to mutual recognition of different legal regimes.
- 373 | This mutual recognition shall ~~take~~-regard ~~of~~ institutional guarantees and information
- 374 | security requirements appertaining to these states and international formats, possibly on the
- 375 | basis of an inter-domain gateway being operated in the frames of an international legal
- 376 | regime.

377 | ~~3) It is recommended~~This paper suggests ~~to describe~~ describing *domain*-constituting mechanisms,
378 | similar to item 2), for legal regimes based on commercial agreements and/or common trade practice.

379 | Communication with international organizations in different areas of standardization on
380 | technical and organizational aspects of forming and functioning transboundary trusted
381 | environment

382 | ~~It is recommended~~This white paper suggests ~~to take~~ taking into consideration the following aspects
383 | of standardization:

384 | 1. Technical and technological aspect

385 | The main objective of standardization in this area is facilitating technical interoperability within the
386 | transboundary trusted environment. This should cover all technical aspects that necessarily impact
387 | functional and security interoperability like documents and data formats, communication protocols,
388 | format and protocol conversions, technical interfaces, the equivalence of the assurance (security)
389 | level of technical components, etc.

390 | 2. Organizational aspect

391 | The main objective of standardization in this area is supporting a *level of trust* between domains
392 | being sufficient for a mutual recognition (legalisation) of electronic documents and data, which are
393 | issued in different *domains* (jurisdictions). This includes, but is not limited to, procedures in respect
394 | of performing conformity audits of *trust service* providers by independent conformity assessment
395 | bodies, of accrediting these conformity assessment bodies, of mutual “peer-to-peer” audits between
396 | the members of the ~~CTI International~~-Coordination Council, objects and areas subjected to the audits
397 | and the applicable audit criteria.

398 | The specified aspects should be considered as applied to different *levels of qualification* of *trust*
399 | *services*. If a *trust service* with a lower *level of qualification* interacts with a *trust service* with a higher
400 | *level of qualification*, the whole *level of qualification* of the interaction between both *trust services*
401 | will be at most equal to the lower *level of qualification*.

402 Annex I - Glossary

403 *Italic face* tags the terms defined ~~for the purposes of this white paper~~in the current Recommendation.

404 For the purposes of this ~~document~~paper the following terms apply:

405 **Common Trust Infrastructure (CTI)**

- 406 • an infrastructure designed to help ensure the *legal significance* of transboundary electronic
407 interaction. *CTI* provides a set of *trust services* harmonized on the legal, organizational and
408 technical / technological levels to its users.

409 **degree of confidence** (of the participants of electronic interaction in each other and in the ICT
410 services processing the electronic interaction between them)

- 411 • a societal function of an established or felt degree of confidence of the participants of
412 electronic interaction in each other and in the ICT services processing the electronic
413 interaction between them.

414 **legal significance** (of an action)

- 415 • a property of an action (of a process) to originate (to result in) documents (data unit)
416 possessing *legal validity*.

417 **legal significance** (of a document)

- 418 • a property of a document (data unit) to change the legal status of a subject of law (a natural
419 or legal person who in law has the capacity to realize rights and juridical duties).
420 A *legally significant* document is always also a *legally valid* one with concrete content.

421 **Legal validity (also called 'legal force') (of a document)**

- 422 • ~~Legal validity (also called 'legal force')~~ is a property of a document (data unit) to be
423 applicable for judicature, i.e. be deemed to have satisfied the requirements of applicable law.
424 The *legal validity* is conferred to a document by the legislation in force, by the authority of its
425 issuer and by the established order of its issuing (e.g. it shall be usable for a subsequent
426 reference).

427 **level of qualification** (or qualification level) (of a service)

- 428 • a property of a service to evidently fulfill a pre-defined set of requirements on it. 438

429 **-levels of trust** (between domains)

- 430 • a societal function determining the degree of trust between *domains*.
431 Depending on an established *level of trust*, *domains* are prepared to share a certain amount
432 of resources and to jointly use certain infrastructures, i.e. *domains* are prepared to delegate
433 part of their inherent powers, functions and resources to a *common trust infrastructure (CTI)*,
434 in which they jointly trust. The higher is the *level of trust* in this *CTI* the more inherent
435 powers domains are prepared to delegate to the *CTI*.

436 **domain** (trust domain)

- 437 • informational and legal space using the same *CTI*. A *domain* can coincide with a single
438 jurisdiction or can unite several jurisdictions.

439 **trust service**

- 440 • (high level definition) - an electronic service ~~purposing proposing~~aiming to ensure a certain
441 *degree of confidence* between the participants of electronic interaction.

442 **trusted electronic interaction**

443 • the exchange of any data in electronic form in such a way that a user of these data
444 undoubtedly accepts them according to its operational policy. Each user's operational policy
445 determines whether the electronic interaction is considered as a trusted one. Hence, the
446 determination of the trustworthiness of data received in an electronic exchange varies from
447 one user to another. Any electronic interaction utilizes information and communication
448 technologies services (such as an internet provider, email provider, message exchange
449 services of any kind, cloud storages, etc.). But *trusted electronic interaction* is provided by
450 using *trust services*.

451

453 | Mathematical description of inter-domain gateway functions

454

- 455 • The set of rules to translate the related requirements between two domains A and B should
456 be laid down within [an](#) inter-domain gateway

457 $A := \{a_1, a_2, \dots, a_N\}$

458 $B := \{b_1, b_2, \dots, b_M\}$

459 $E(a) := A \rightarrow B$

460 Where A is the set of requirements (attributes) for domain A, B – the set of requirements for
461 domain B and E(a) is the set of transformation rules from A to B. Taking in mind that powers
462 of sets (i.e. quantity of requirements in a real word) can be not equal ($N \neq M$), there should
463 be rules defined to lead both sets to equal power K where $K := \text{MAX}(N, M)$.

464

- 465 • The degree of trust to such set of transformation rules can be defined as transformation to
466 some universal superset of requirements, and such transformation is performed inside each
467 domain.

468 $E(a) := A \rightarrow X$

469 $E(x) := X \rightarrow B$

470 Where X is universal superset of requirements for A and B.
