

# RDM2API TS

Web-Meeting on 25.01.202

UN / CEFAC

- Andreas Pelekies presented the current state of the draft document
- Decisions of the group:
  - Use the latest JSON schema specification
  - Representation of data types, especially
    - Date: in addition to date / time a representation of a period is necessary – to be implemented as a choice between date / time and period
    - Numeric: JSON does not have a generic decimal type but for business reasons such a type is required; to be implemented as a string with a pattern
    - Indicator: although available in CCTS never used in RDM; for JSON, the Boolean type shall be available
  - ASBIE: choice between RESTful representation and document centric representation shall be supported
- Next meeting: 08.02.2022
